

**Features**

- High-speed: 35, 70 ns
- Ultra low DC operating current of 5mA (max.)  
TTL Standby: 5 mA (Max.)  
CMOS Standby: 60  $\mu$ A (Max.)
- Fully static operation
- All inputs and outputs directly compatible
- Three state outputs
- Ultra low data retention current ( $V_{CC} = 2V$ )
- Single  $5V \pm 10\%$  Power Supply

■ Packages

- 32-pin TSOP (Standard)
- 32-pin 600 mil PDIP
- 32-pin 440 mil SOP (525 mil pin-to-pin)

**Description**

The V62C5181024 is a 1,048,576-bit static random-access memory organized as 131,072 words by 8 bits. It is built with MOSEL VITELIC's high performance CMOS process. Inputs and three-state outputs are TTL compatible and allow for direct interfacing with common system bus structures.

**Pin Descriptions**

**A<sub>0</sub>–A<sub>16</sub> Address Inputs**

These 17 address inputs select one of the 128K x 8 bit segments in the RAM.

**$\overline{CE}_1$ , CE<sub>2</sub> Chip Enable Inputs**

$\overline{CE}_1$  is active LOW and CE<sub>2</sub> is active HIGH. Both chip enables must be active to read from or write to the device. If either chip enable is not active, the device is deselected and is in a standby power mode. The I/O pins will be in the high-impedance state when deselected.

**$\overline{OE}$  Output Enable Input**

The Output Enable input is active LOW. When  $\overline{OE}$  is LOW with  $\overline{CE}$  LOW and  $\overline{WE}$  HIGH, data of the selected memory location will be available on the I/O pins. When  $\overline{OE}$  is HIGH, the I/O pins will be in the high impedance state.

**$\overline{WE}$  Write Enable Input**

An active LOW input,  $\overline{WE}$  input controls read and write operations. When  $\overline{CE}$  and  $\overline{WE}$  inputs are both LOW, the data present on the I/O pins will be written into the selected memory location.

**I/O<sub>0</sub>–I/O<sub>7</sub> Data Input and Data Output Ports**

These 8 bidirectional ports are used to read data from and write data into the RAM.

**NOTE:**

- Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

1.  $\overline{WE} = V_{IH}$ .
2.  $\overline{CE}_1 = V_{IL}$  and  $CE_2 = V_{IH}$ .
3. Address valid prior to or coincident with  $\overline{CE}_1$  transition LOW and/or  $CE_2$  transition HIGH.
4.  $\overline{OE} = V_{IL}$ .
5. Transition is measured  $\pm 500mV$  from steady state with  $C_L = 5pF$ . This parameter is guaranteed and not 100% tested.

NOTES:

1. The internal write time of the memory is defined by the overlap of  $\overline{CE}_1$  and  $CE_2$  active and  $\overline{WE}$  low. All signals must be active to initiate and any one signal can terminate a write by going inactive. The data input setup and hold timing should be referenced to the second transition edge of the signal that terminates the write.
2.  $t_{WR}$  is measured from the earlier of  $\overline{CE}_1$  or  $\overline{WE}$  going high, or  $CE_2$  going LOW at the end of the write cycle.
3. During this period, I/O pins are in the output state so that the input signals of opposite phase to the outputs must not be applied.
4.  $\overline{OE} = V_{IL}$  or  $V_{IH}$ . However it is recommended to keep  $\overline{OE}$  at  $V_{IH}$  during write cycle to avoid bus contention.
5. If  $\overline{CE}_1$  is LOW and  $CE_2$  is HIGH during this period, I/O pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.
6.  $t_{CW}$  is measured from  $\overline{CE}_1$  going low or  $CE_2$  going HIGH to the end of write.
